Script-Controlled ACL – Restrict Record Access Based on Field Value

PHASE 1 – BRAINSTORMING & IDEATION

Problem Statement

In ServiceNow, different users may require different levels of access to records. Unrestricted access can expose sensitive information and allow unauthorized users to create, modify, or delete records.

Proposed Solution

Implement Script-Controlled Access Control Lists (ACLs) using user roles, branch values, and operation types to control record access.

Project Objectives

• Implement secure record-level access control.
• Restrict unauthorized users from viewing records.
• Control CREATE, READ, WRITE, and DELETE operations.
• Protect sensitive student information.
• Verify access using ServiceNow impersonation.

Target Users

ServiceNow administrators, EEE branch users, faculty users, and authorized project users.

Key Features

Custom roles, custom ServiceNow table, branch-based record access, scripted READ ACL, CREATE ACL, WRITE ACL, DELETE ACL, and administrator full access.

Expected Outcome

Authorized users can access only the records and operations permitted by their roles while unauthorized access is prevented.
