Script-Controlled ACL – Restrict Record Access Based on Field Value

PHASE 7 – PROJECT DOCUMENTATION

Project Overview

This project demonstrates how ServiceNow ACLs can protect records from unauthorized access by combining custom roles and scripted ACL logic.

Technologies Used

ServiceNow, JavaScript, ACL, User Roles, and Custom Tables.

Security Model

bb1 → READ
bb2 → CREATE
bb3 → WRITE
bb4 → DELETE
Admin → Full Access

Benefits

Protects sensitive information, prevents unauthorized access, provides role-based security, controls record operations, and improves data security.

Limitations

Requires correct role configuration. Incorrect ACL configuration can affect access. Users must be assigned appropriate roles. Script logic must be maintained when requirements change.

Future Enhancements

Department-based access control, dynamic role assignment, advanced field-level security, automated security testing, audit and monitoring, and external identity integration.

Conclusion

The project demonstrates implementation of Script-Controlled ACLs in ServiceNow to manage secure access to records.
